

FACET is one part of the decision-making processes that TFK uses to determine if it has the appropriate resources and skills to be able to safely deploy to a disaster area.

This tool is being made available to small, low-resource, Disaster Relief organisations in an Open-source philosophy to allow you to customise to your needs.

The tool is available in the following formats:

- 1) Spreadsheet
- 2) App (web, Android and IOS)

For further information, please contact me at

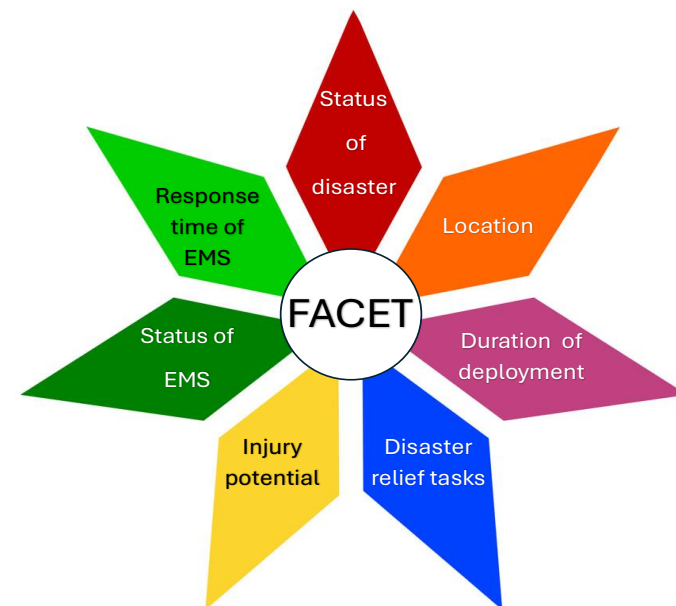

malinzachau@yahoo.com

For more information on how TFK have developed and use the FACET tool please scan QR code to link to my website for further details

Thank you very much indeed for your interest in FACET

First Aid Complexity Engagement Tool

A calculator for disaster relief charities to objectively determine the appropriate level of in-house first aid skills needed to enable first aid self-sufficiency during deployment

by Dr Malin Zachau (retired)

M.B., B.S.; D.R.C.O.G.; DIMC

The First Aid Complexity Engagement Tool (FACET) is a novel calculator developed for Taskforce Kiwi, a veteran-led disaster relief charity in New Zealand.

FACET is used early in the decision making process to help with team selection. Based on information about the deployment it objectively determines the appropriate first aid team composition needed for this disaster deployments. It does this by evaluating seven parameters: disaster status, location, duration, disaster relief tasks, injury potential, local emergency services availability, and emergency response time.

FACET identifies the first aid skills needed to help the teams be as self-sufficient as possible in the event of an injury during deployment without burdening a disaster affected community, for non-life-threatening injuries.

FACET is the first step in ensuring a disaster relief team has the most appropriate volunteer skills and medical oversight in place. It can also be used by non-medical trained personnel to identify first aid needs.

Retrospective testing on actual deployments has validated FACET's ability to quantify first aid requirements that might otherwise rely on subjective assessment.

To be self-sufficient **Telemedicine support** and **pre-approved medication protocols** (Standing orders) will significantly enhance the capabilities of personnel with less medical training. Basic First Aid, Disaster First Aid, and Medic/EMT volunteers should only be deployed when proper communication and medical supervision systems are in place. While this oversight is preferable for Healthcare Professionals in the field, it may not be absolutely necessary for them.

FACET is a resource management decision tool to assist in ensuring correct team composition for disaster deployments commensurate with austerity and situation. FACET is an input to the risk-management and mitigation process. Using this tool, you can:

- Identify trained team members from your volunteer pool
- Enhance your risk assessment and mitigation strategy
- Make informed go/no-go decisions for the deployment
- Open discussions for partnering with other organisations or agencies who have the medical capability required

Please note:

- **This demonstration app is for entertainment purposes only and is not intended for actual deployment planning. The parameters must be reset for each specific disaster organisation**
- **This tool is not intended to provide medical advice**
- **It is based on no mitigation measures being in place (worst possible outcome)**
- **Use at your own risk**
